Changes from the Design Document to the Final Version

- Features
    - Added the option to remove your published/edited sites
    - Added the feature of viewing published sites from other people
    - Couldn't implement some of the tentative features like drag and drop, drawing, really cool/obscure HTML elements, or reordering elements.
    - Only one template was available. One really good template, but still one template. We had originally planned for three to four being available.
- Python + JS Modules
    - We only have fewer python files, and one more Javascript file, as well as various javascript functions located in script tags inside of the HTML files.
        - app.py
            - Runs the whole thing.
            - Handles user interface and backend manipulation.
        - auth.py
            - Login and logout functionality.
        - savefiles.py
            - Saving/writing to files for edit/publish feature.
            - Removing files.
            - Database interactions for these features.
        - jcolor.js
            - Handles the color picker in the template.
        - edit.js
            - Most of the javascript functions, from the AJAX functions to the adding or removing elements when editing a template.
    - Files in design document that ended up not requiring their own file.
        - permbowls.py
            - Generates the base website/serves up initial template.
        - upload.py
            - Responsible for uploading images.
        - acc.py
            - Generates data for account page.
- Breakdown of Tasks
    - Sarah's role focused more on template designs.
    - Max also handled extra debugging and user error cases.
    - Brian worked more on saving and publishing than previously expected, as well as on the AJAX/jQuery calls.
    - Michael worked more on app.py than initially planned.
- Site Map

- ○ Generally unchanged.
- ○ Template selector is part of homepage.
- ○ Two additional pages, remove site and view popular sites came up as well.
- **Component Map**
  - ○ In terms of relationships, everything stayed the same but certain files merged together, so the web became more lines/arrows and less boxes.
  - ○ Permbowls.py and upload.py combined into app.py.
  - ○ Acc.py and save.py combined to make savefile.py.
- **Timeline**
  - ○ Followed the deadline except:
    - ■ January 9th:
      - ● Realized one really good advanced template was better than multiple "basic" templates.
    - ■ January 11th:
      - ● Fell behind on feature of saving sites.
    - ■ January 12th:
      - ● Made dummy accounts, only to clear them later because of a template error.
      - ● Got saving sites to work.
    - ■ January 16th:
      - ● Javascript functions were not done, much more complex than expected.
      - ● Publishing sites now works.
    - ■ January 18th:
      - ● No additional templates because of realization on January 9th.
    - ■ January 21st:
      - ● Drag and drop was not implemented.
    - ■ January 23rd:
      - ● Had not finished.
    - ■ January 24th:
      - ● Filmed video.
    - ■ January 25th:
      - ● Polish and finish.
